

SPRINT PROJECT

Group name: Dim minds
Case: **Byens Ismejeri**

Requirements

Device: Phone

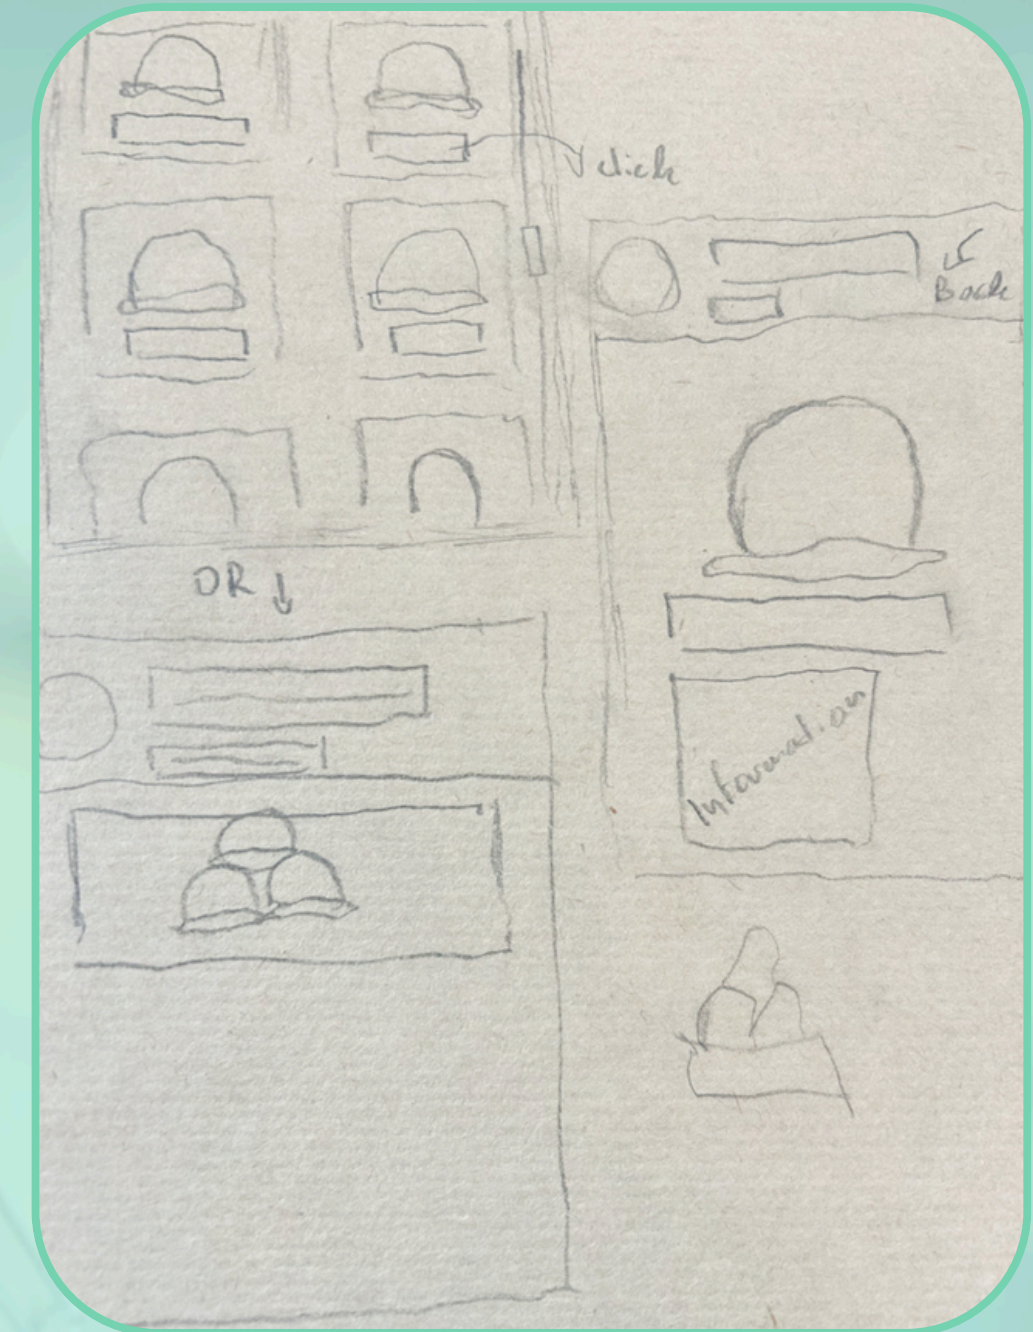

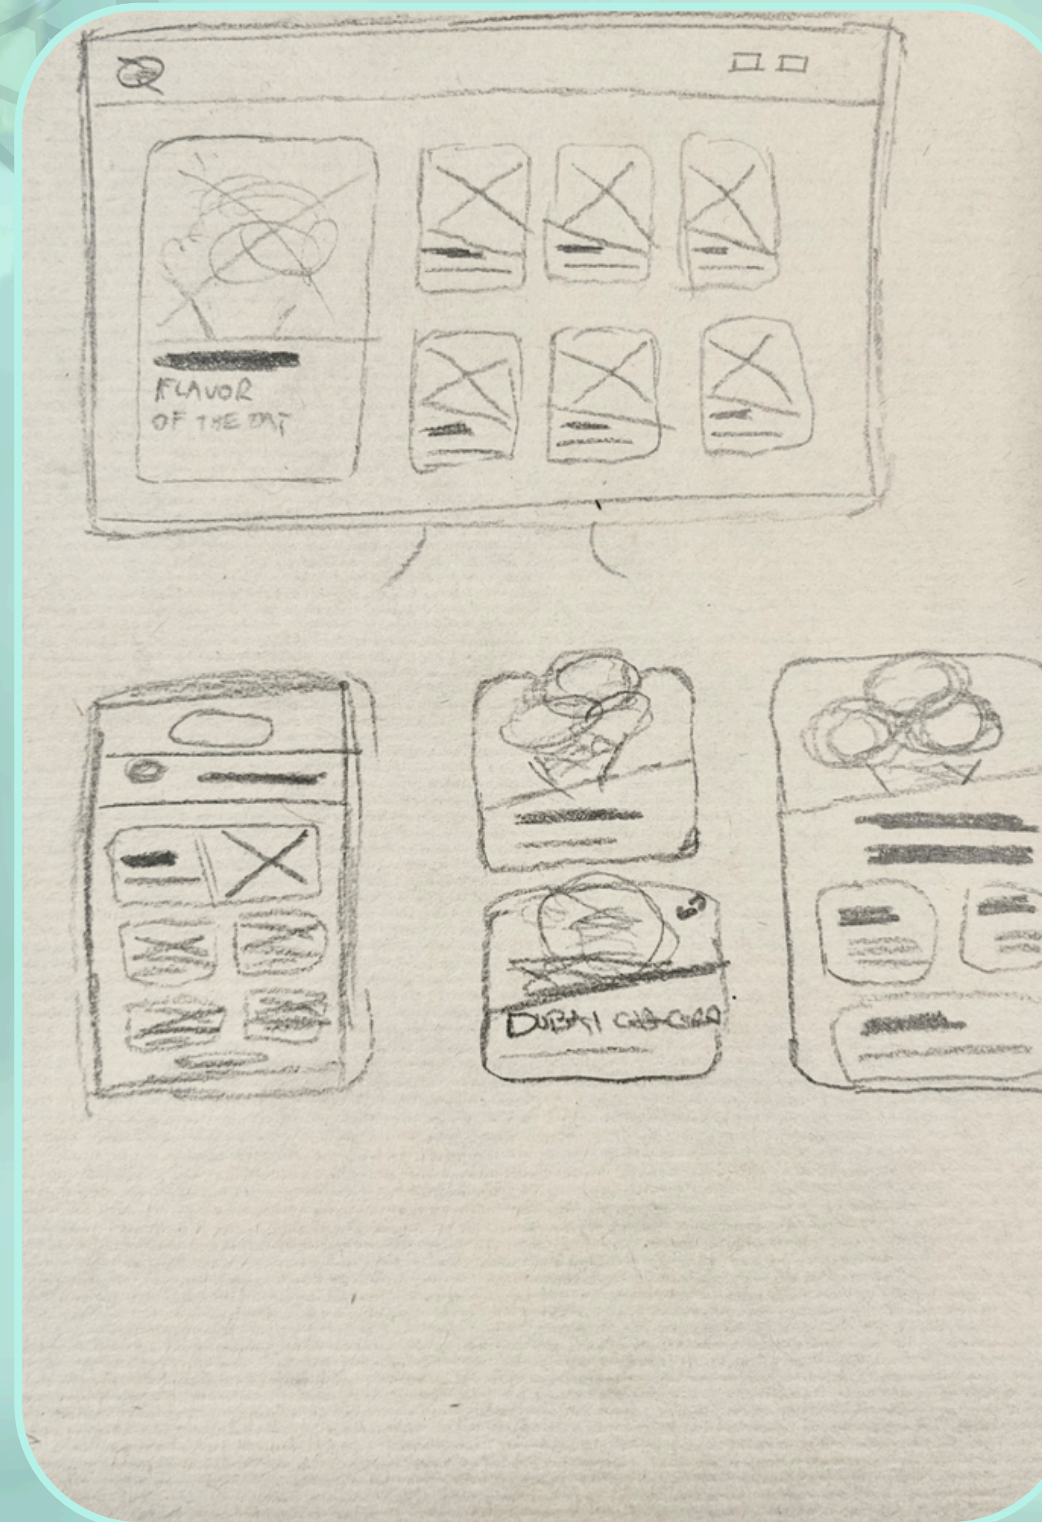

Language: English and Danish.

Accessibility features: Text to speech

Elements: Text, images, buttons, a pop up, QR code.

Header: Name and logo, link to the official website, language.

Body: Pictures and names of ice creams.

Sketches

Values

Cozy

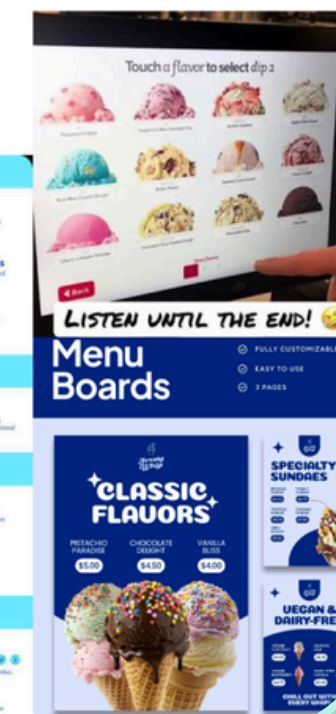

Retro-modern

Up to date

Creative

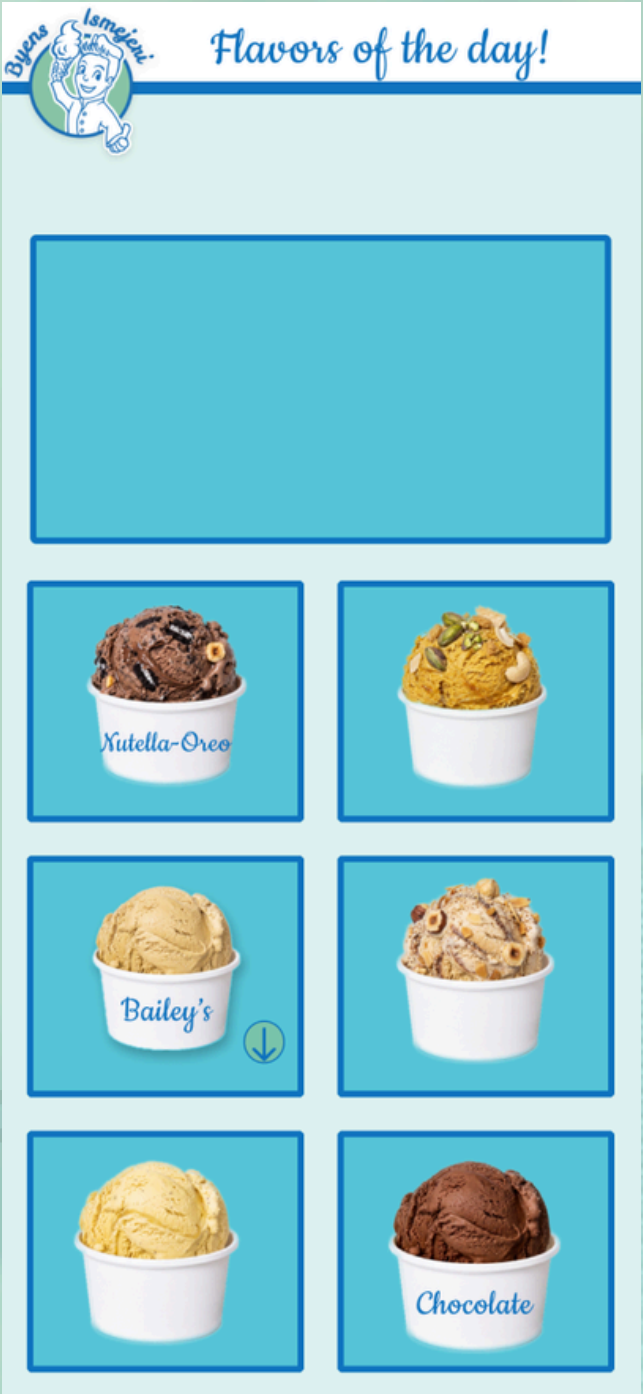

Joyful

Simple

Moodboard

Figma prototype

Code

```
<header>
  <div id="header">
    <a href="#">
      <h1>Today's flavors
    <p id="language">
    </div>
  </header>
```

```
[
  {
    "flavor": "Nut dream"
    "allergens": ["Soy Lecithin", "Alcohol", "Coconut", "Soy Lecithin"]
    "traces": "Cashew Nut"
    "status": "Available"
    "img": "ic_nutdream.png"
  },
  {
    "flavor": "Nutella/Oreo"
    "allergens": ["Hazelnut", "Alcohol", "Coconut", "Soy Lecithin"]
    "traces": "Standard"
    "status": "Available"
    "img": "ic_nutellaoreo.png"
  },
  {
    "flavor": "Bailey's"
    "allergens": ["Alcohol", "Coconut", "Soy Lecithin"]
    "traces": "Standard"
    "status": "Available"
    "img": "ic_baileys.png"
  }
]
```

```
<section>
  <div id="ice-cream-cards">
    <div id="card">
      <p>${item.flavor}</p></div>
    </div>
  </div>
</section>
```

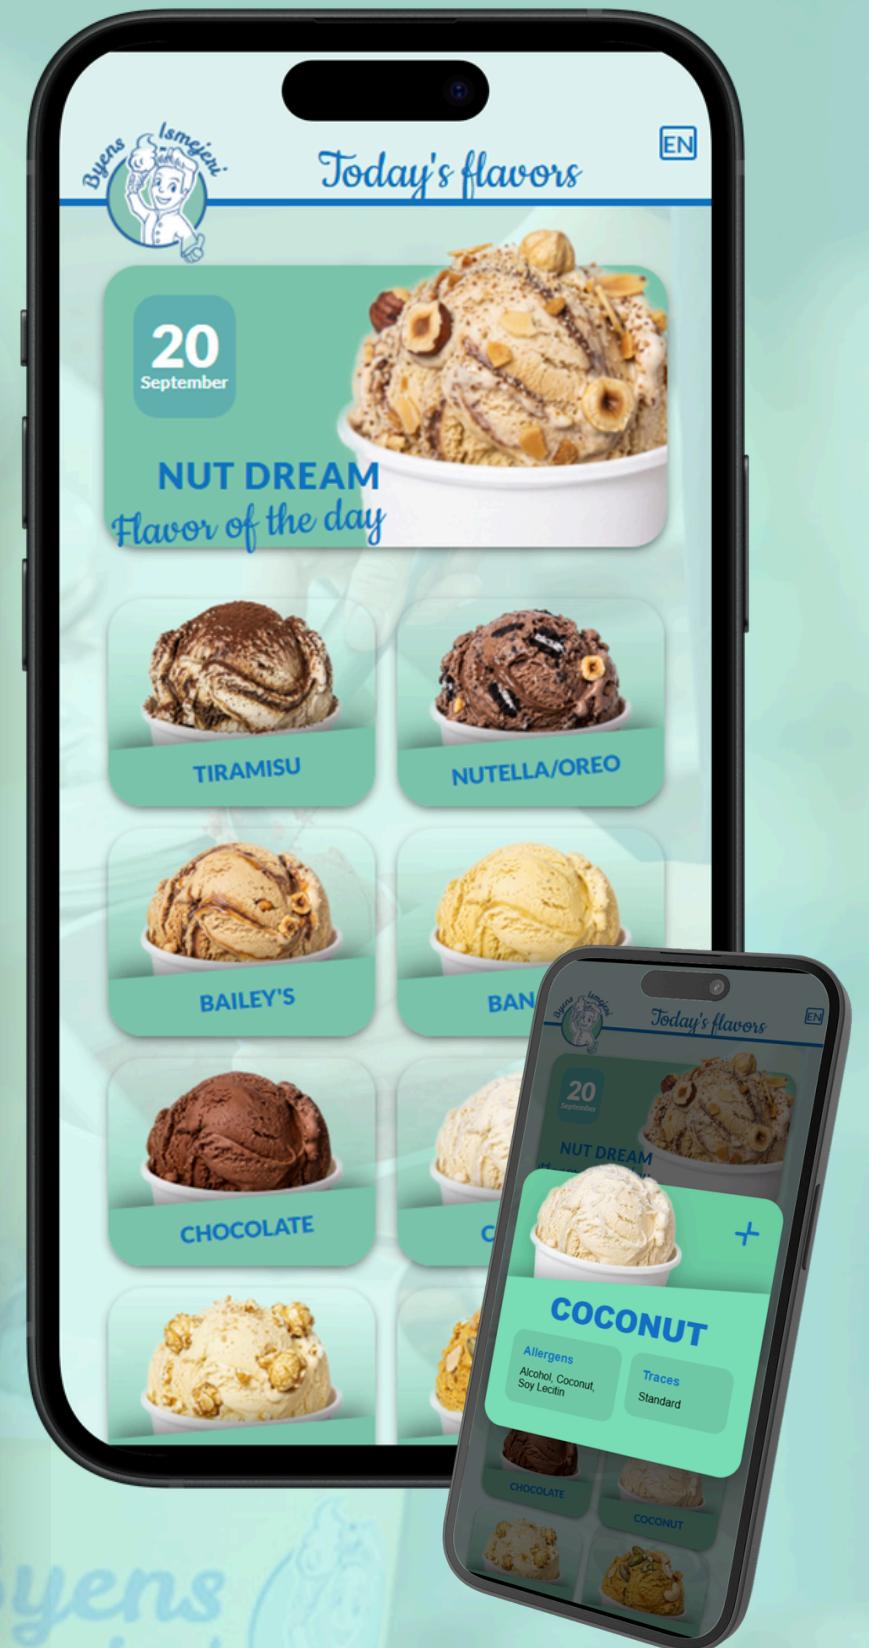

```
// ? Fetching the ice cream data from the JSON file
let iceCreams = []; // * We will store the json in this variable

fetch('icecreams.json') // * We fetch the data from the JSON file
  .then(response => response.json()) // * We make sure the data format is JSON
  .then(data => {
    iceCreams = data; // * We store the data in the iceCreams variable.
    console.log(iceCreams); // Just for debugging
    showDayFlavor();
    createCards(iceCreams); // * We call the function that will create our cards and passing the
    data to it
  })
  .catch(error => console.error('JSON Error: ', error)) // If there's an error, we catch it here, for
  debugging
```

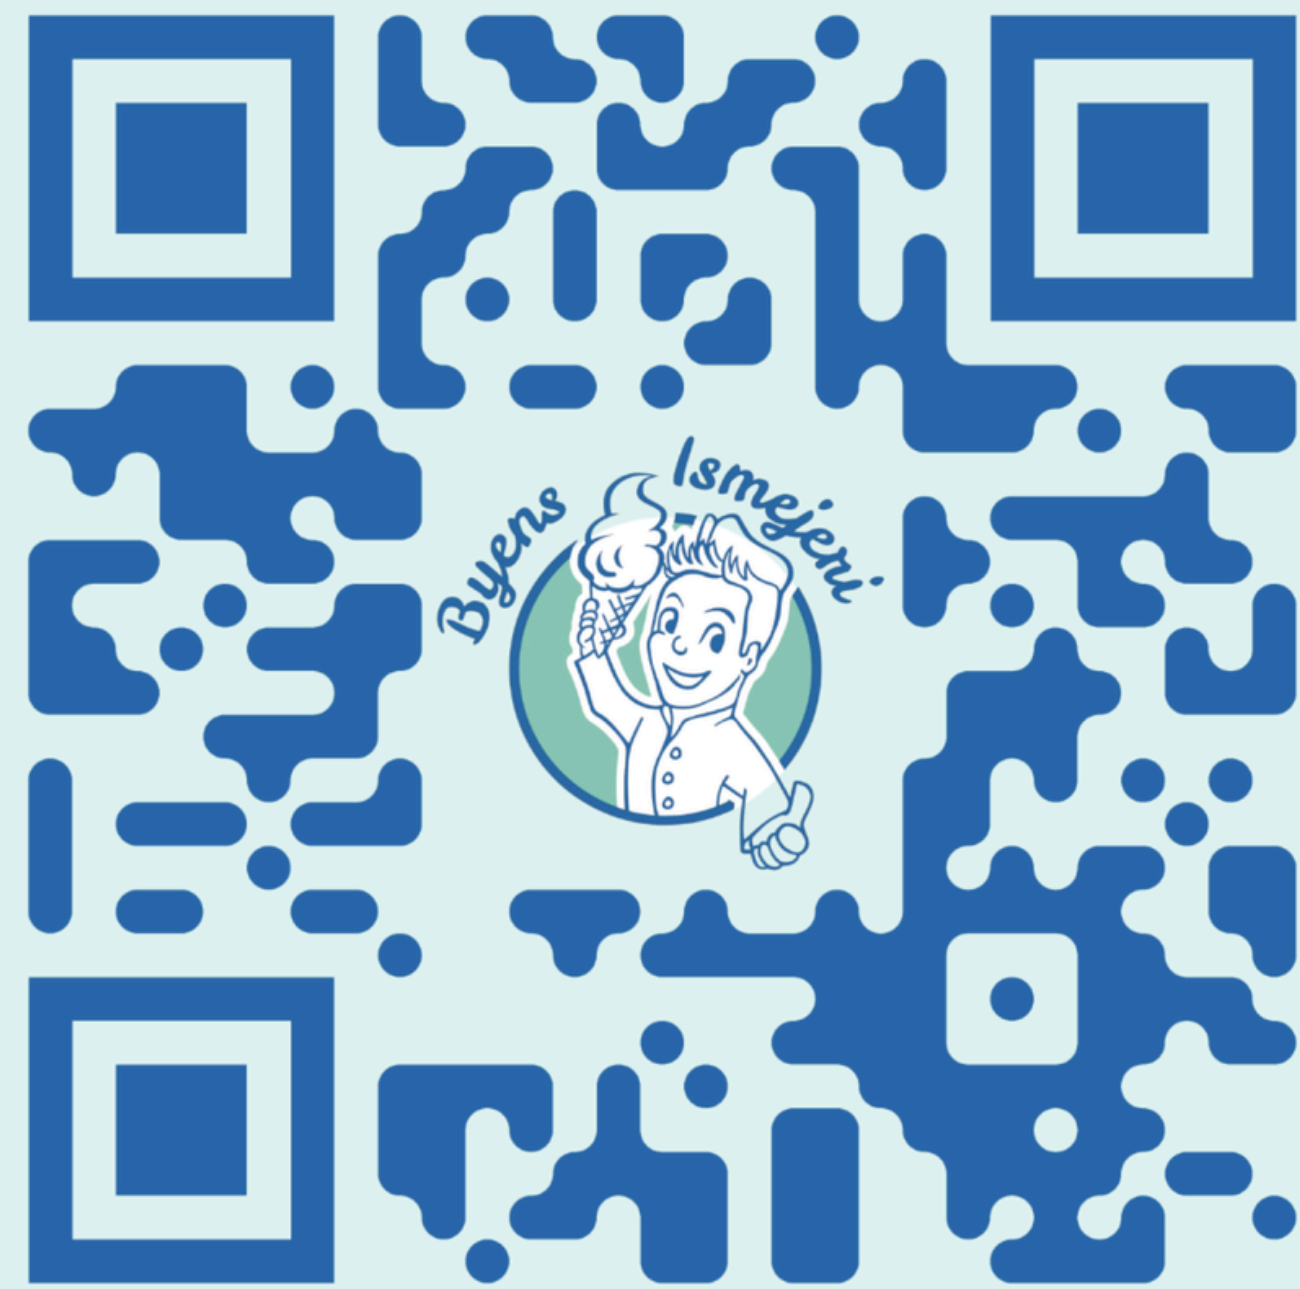

```
// ? Creating the cards
function createCards(iceCreams) { // * The function that creates the cards themself

  const container = document.getElementById('card-container'); // * We select the container by ID.
  ("const" is a constant value)
  container.innerHTML = ''; // * We clear the container, so it don't stack cards ontop of each other
  if we ever decide to refresh the data

  iceCreams.forEach((item, index) => { // * forEach will repeat for each entry in the JSON
    if (index == 0) return; // * We skip the first entry
    const html = `
    <div id="card" onclick='openModal(${JSON.stringify(item).replace(/'/g, "&#39;")})'>
      <p>${item.flavor}</p></div>
    </div>
    `; // * We store each ice cream's data in the onclick event as "item"
    container.innerHTML += html; // * We add the new card to the container
  })
}
```

Solution

Try it!
